Rising Pandemic of Diabetes

The International Diabetes Federation (IDF) has estimates that there are nearly 371 million people in the World suffering from diabetes. India accounts for 61.3 million diabetic patients of the world. As per IDF, this figure is expected to reach a staggering 100 million mark by 2030, unless significant efforts are made to curb this disease. Even more concerning is that the steep rise in the incidence of diabetes heightens the risk of heart and chronic related diseases massively. The economic expenditure on diabetes is also mounting every year.

Half of the people with diabetes in India are undiagnosed and a majority them live in rural areas. More than 9,83,000 deaths in India are attributable to diabetes. Due to inadequate awareness and medical care in the rural spaces, diabetes control remains a major challenge. In addition, poor implementation and monitoring makes the existing programs ineffective.

The rampant increase of in diabetes in India calls for better policies and health care delivery system to combat the rising burden. Diabetes patients can live normal healthy life if proper care is taken. Creating awareness on the part of people and administration is very essential to manage and prevent diabetes. People should be made aware and educated about their health and fitness level to reduce the number of patients in India.

World Facts about diabetes as per IDF

In 2012
- More than 371 million people have diabetes in the world
- The number of people with diabetes is increasing in every country
- Half of people with diabetes are undiagnosed
- 4.8 million people died due to diabetes
- More than 471 billion USD were spent on healthcare for diabetes

National NCD Summit to Combat Diabetes

National NCD Summit on “Strengthening Policies for Diabetes care” was organized by the Confederation of India (CII) in partnership with Eli Lilly and supported by the Ministry of health and family welfare and the Indian Council of research. With the increasing burden of Non Communicable Diseases (NCD), the Summit was a noble effort towards the greater objective of making India better prepared to combat the rising burden of diabetes.

The Summit was directed towards raising attention to the health care delivery system, influencing the policy advocacy and preparing the stakeholders to rise up to the challenges of the NCDs (Non communicable diseases) facing the country.

The discussions of the program were centered on three key objectives:
- Sensitization and capacity building of all key the stakeholders on policies and practices around NCDs
- Learning and sharing of global and national best practices to shape up and strengthen the ongoing initiatives in India
- Identifying and promoting Public private partnerships (PPP) for better implementation of the practices on the ground

Special points of Interest:
- India is home to 61.3 million diabetic patients of the world
- Policies and processes to combat diabetes need to be strengthened
- Information technology is the means to reach a wider population and achieve better results
- Automation of processes in health care through mobile phones should be considered
At the National NCD summit, policies and challenges to managing diabetes were brought to notice.

Various aspects related to NCDs and their cure were deliberated, with a focus on diabetes. Several sessions were conducted to address topics like Causes responsible for diabetes, Current global and national practices, prevention and management of diabetes, training and development of human capital and role of technology in tackling NCDs. The Summit identified the emergence of Information Technology as means to facilitate effective management of the NCD programs. It emphasized the role of a robust management information system for the success of the tackling NCDs in India.

Additional Secretary, Ministry of Human Resource Development discussed how the whooping presence of mobile phones in the poorest of areas with no media or internet connectivity can be leveraged to impart proper health facilities to the masses. Senior Vice president of Project Hope gave a presentation on how through technology they are running a successful training and development program for the health care functionaries all over the world.

Associate professor of College of pharmacy, PURDUE University mentioned the vast gap between the health care facilities and its reach to patients and observed technology as the “Glue” to stick together the medical facilities and the beneficiaries.

The question then is; how do we raise awareness and ensure proper supply of medical care and medicines in rural areas where illiteracy rates are high and medical infrastructure is abysmal.

The answer to these problems is automation of the processes through a medium that addresses the obstruction of widespread illiteracy, limited access to media and no access to internet in the regions.

The panel of officers reflected on the use of mobile phones as an effective resolution to these challenges. 80% of the population in India lives in rural areas with low income levels, widespread illiteracy, no internet and no media penetration.
Information Technology – Aid to Health Care

To overcome these limitations, the Joint Secretary referred to the growing use of mobile phones as the definitive medium to bring about a revolution in the way health care industry functions. India is the second-largest mobile phone user with over 900 million users in the world. The immense potential of the mobile phones can be leveraged to reach out to people, especially those living in remote areas. It can be used to integrate and enhance the existing Health related- IT enabled Systems. The medium of mobile based Information Technology can be utilized to deliver a full circle of health care services like:

- Supply chain monitoring
- Validating delivery of services
- Ensuring quality service delivery
- Registering Patient feedbacks
- Raising health awareness among people
- Training medical functionaries and professionals
- Counseling the patients

Gram Vaani works in the space of mobile technology and IVRS to provide “Last mile connectivity with the Bottom of the Pyramid”

Gram Vaani Mobile and IVR Services to automate Health Care processes

The vast of ambit of mobile based solutions offers to bridge the gaps in health care operations in myriad ways. Interactive Voice Response Systems (IVRS) on mobile phones provides a host of services to reach a millions while breaking the barrier of illiteracy and digital divide. Services on mobile like Mobile-health, Mobile- survey, Mobile-learning, Mobile- tracking etc to automate processes ensures quick and high quality outcomes. It can be utilized for the purpose of:

- Providing mobile learning and training to health functionaries
- Tracking and monitoring the supply of medical drugs and equipment
- Monitoring medical staff
- Raising health awareness amongst people
- Obtaining customer feedbacks
- Conducting health surveys

Gram Vaani works in the space of mobile technology and IVRS to provide “Last mile connectivity” with the Bottom of the Pyramid (BOP). We provide Information technology solutions for health care, social and corporate sectors.

Our mobile based technology platform serves to connect the organizations and Government with the low income population who has no access to any forms of communication. We automate the business processes through our automated suite of products- vAutomate. vAutomate renders various services like vHealth, vSurvey, vLearn, vAnswer, vAct, vInform, vTrain, vHelp, and many more, to reach the unreached under served markets.
